

Production-Quality Interactive Course Labs, Built with AI

Tim Fraser, Ph.D.

Assistant Teaching Professor, Systems Engineering
Cornell University · tmf77@cornell.edu
SYSEN 5470 · timothyfraser.com/netsci

11 interactive labs

21 project datasets

2 languages, one lesson

17 packages, zero installs

\$0 servers or hosting

THE PROBLEM

Students learn networks by breaking them, not by reading about them. But one production-quality lab is weeks of web engineering. A course needs dozens — plus datasets, codebooks, and teaching code in two languages.

THE AI WORKFLOW

- 1 Encode the conventions.** Teaching style, dataset rules, and glossary become reusable AI skills.
- 2 Draft with AI.** A lab, a dataset generator, or matched R + Python code.
- 3 Verify automatically.** Browser tests per lab; answers recomputed live; R and Python must agree.
- 4 Instructor reviews.** Pedagogy, tone, and accuracy — before anything ships.
- 5 Ship free and static.** GitHub Pages. CI rebuilds the student repo and study companion.

21 DATASETS

Each hides a planted story that survives naive analysis, with a codebook and R + Python loaders.

Case-study lab. Remove a station and every metric updates live.

Coding playground. A full R or Python interpreter in the browser tab, via WebAssembly.

Network Visualizer. Click through failure cascades and counterfactuals on a 300-node grid.

WHAT STUDENTS GET

- Real code, no setup. R and Python in the browser.
- Labs that push back. Metrics move as you edit.
- Explore, then code. Export the script you clicked.
- A tutor that asks. Socratic AI, never answers.

TRY IT RIGHT NOW
